

AI Doesn't Have To Be Scary.

Here are 6 basic terms to get started

Ansel Natarajan
iep-pal.com

Understanding Model Basics

- **LLM (Large Language Model)**

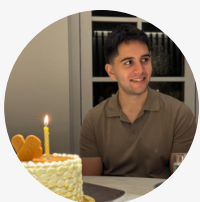

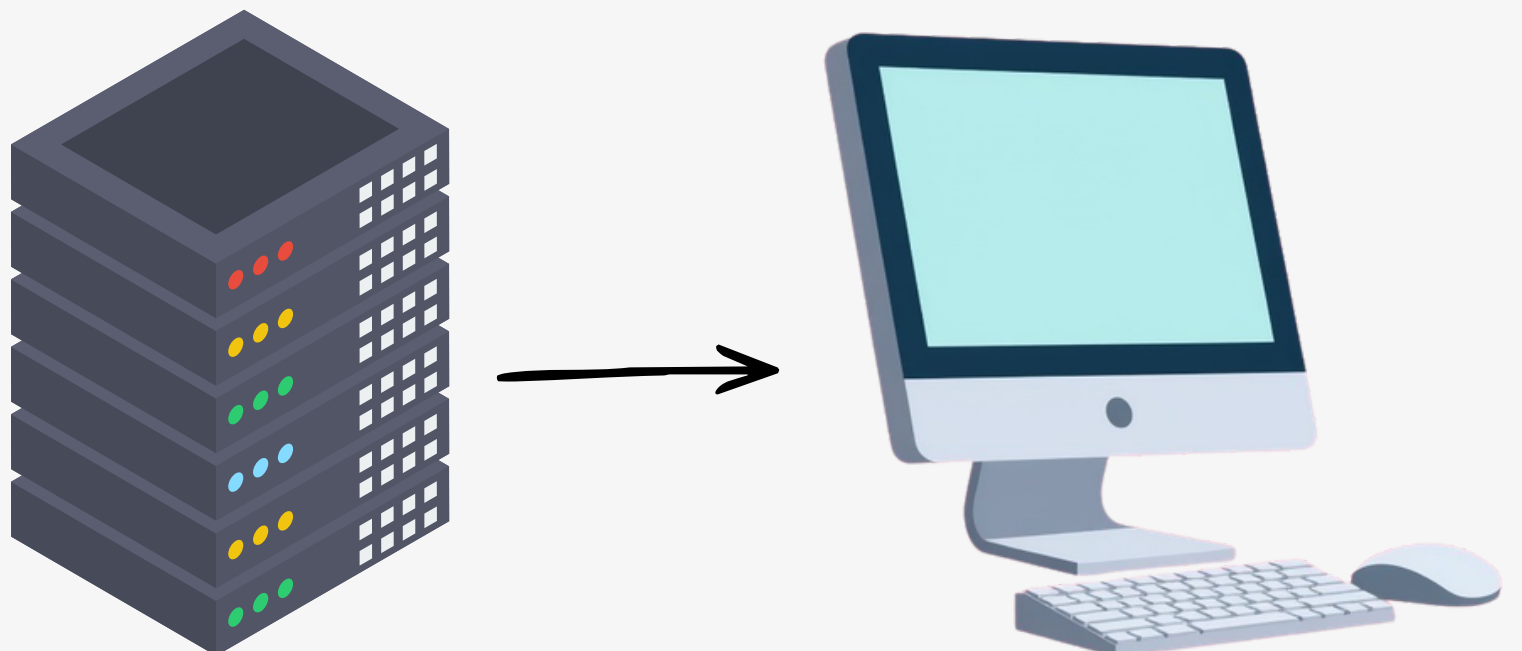

The actual name for tools like ChatGPT, Claude, and Gemini. A model trained on billions of words to predict what text should come next.

- **Token**

How AI measures text. About 4 characters = 1 token. This is why AI tools have usage limits — they're counting tokens, not words.

- **Hallucination**

When an AI sounds certain and is completely wrong. It's not lying — it's pattern-matching toward a plausible answer even when the facts don't exist.

These 6 cover most of what you'll encounter in the wild.

- **Context Window**

The AI's working desk. Everything in your current conversation sits on it. Once the desk is full, older messages fall off — and the AI genuinely forgets them.

- **Prompt**

What you type into an AI. The more specific your input, the better the output. You're already doing this. You can get much better at it.

- **AI Agent**

An AI that takes actions, not just answers questions. It can browse the web, run code, draft emails, and plan steps on its own.

AI Doesn't Have To Be Scary

I've seen how powerful AI can be firsthand building iep-pal.com for special education teachers.

My goal is to help you conquer AI :D
